

The debate about the need to formulate new policies and improve current water management systems has gained relevance worldwide, and Chile is no exception. Climatic phenomena, such as droughts, have increased in frequency and severity, which is mainly associated with climate change and this trend, is expected to continue or even intensify.

That is why Salmones Camanchaca declares that the management of water resources is a priority within its business strategy, evaluating it within the organization's risk management.

Salmones Camanchaca is constantly implementing more efficient production actions throughout its entire product value chain, through control measures such as:

- Measuring the Water Footprint of our operation.
- Requiring our suppliers to contribute to the care and efficiency in water consumption, its quality, and controlling or improving production processes.
- Identifying potential conflicts over water resources in order to avoid risks associated with future emergency situations.
- Ensuring that water returned to the environment maintains optimal quality through the implementation of rigorous treatment of effluents generated in our operations.
- Ensuring that the company's operations do not compromise the right of local communities to access water.

For Salmones Camanchaca, water management is an essential priority due to its value as a natural and economic resource. We strive to ensure efficient and equitable use of water while simultaneously promoting the conservation and protection of water resources.
